Experiment No. 5: Circular Queue

Aim: To Implement Circular Queue ADT using array

Objective:

Circular Queues offer a quick and clean way to store FIFO data with a maximum size

Theory:

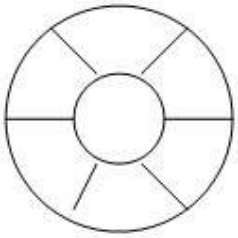
Circular queue is an data structure in which insertion and deletion occurs at an two ends rear and front respectively. Eliminating the disadvantage of linear queue that even though there is a vacant slots in array it throws full queue exception when rear reaches last element. Here in an circular queue if the array has space it never throws an full queue exception. This feature needs an extra variable count to keep track of the number of insertion and deletion in the queue to check whether the queue is full or not.Hence circular queue has better space utilization as compared to linear queue. Figure below shows the representation of linear and circular queue.

Linear queue

Front rear

0	…	…		n

Circular Queue



Algorithm

Algorithm : ENQUEUE(Item)

Input : An item is an element to be inserted in a circular queue.

Output : Circular queue with an item inserted in it if the queue has an empty slot.

Data Structure : Q be an array representation of a circular queue with front and rear pointing to the first and last element respectively.

1. If front = 0

   front = 1

   rear =1

```
        Q[front] = item
2.  else
        next=(rear mod length)
        if next!=front then
            rear = next
            Q[rear] = item
        Else
            Print "Queue is full"
        End if
    End if
3.  stop
```

Algorithm : DEQUEUE()

Input : A circular queue with elements.

Output :Deleted element saved in Item.

Data Structure : Q be an array representation of a circular queue with front and rear pointing to the first and last element respectively.

```
1.  If front = 0
        Print "Queue is empty"
        Exit
2.  else
        item = Q[front]
        if front = rear then
            rear = 0
            front=0
        else
            front = front+1
        end if
    end if
3.  stop
```

Code:

```
 #include <stdio.h>

#include <conio.h>

#define MAX 10

int queue[MAX];

int front=-1, rear=-1;

void insert(void);

void display(void);

int main()

{

int option;

clrscr();

do

{

 printf("\n CIRCULAR  QUEUE IMPLEMENTATION ");

 printf("\n");

 printf("\n 1. Insert an element");

 printf("\n 2. Display the queue");

 printf("\n 3. EXIT");

 printf("\n Enter your option : ");
```

```
 scanf("%d", &option);
switch(option)
 {
 case 1:
 insert();
break;
case 2:
 display();
break;
 }
}while(option!=3);
getch();
return 0;
}
void insert()
{
int num;
printf("\n Enter the number to be inserted in the queue : ");
scanf("%d", &num);
if(front==0 && rear==MAX-1)
 printf("\n OVERFLOW");
```

```
else if(front==-1 && rear==-1)
{
front=rear=0;
 queue[rear]=num;
}
else if(rear==MAX-1 && front!=0)
{
rear=0;
 queue[rear]=num;
}
else
{
 rear++;
 queue[rear]=num;
}
}
void display()
{
int i;
printf("\n");
if (front ==-1 && rear==-1)
```

```
 printf ("\n QUEUE IS EMPTY");
else
{
 if(front<rear)
 {
 for(i=front;i<=rear;i++)
 printf("\t %d", queue[i]);
 }
 else
 {
 for(i=front;i<MAX;i++)
 printf("\t %d", queue[i]);
for(i=0;i<=rear;i++)
 printf("\t %d", queue[i]);
 }
}
}
```

Output:

CIRCULAR QUEUE IMPLEMENTATION

1. Insert an element

2. Display the queue

3. EXIT

Enter your option : 1

Enter the number to be inserted in the queue : 23

CIRCULAR QUEUE IMPLEMENTATION

1. Insert an element

2. Display the queue

3. EXIT

Enter your option : 3

Conclusion:

Q1 Explain how Josephus Problem is resolved using circular queue and elaborate on operation used for the same.

Joseph Problem can be resolved using circular queue by:

1) creating a circular queue with n

2)Initial a counter for m

3) Repeat the following steps until only one person remains i.e n=1

>Dequeue m-1 people

>eliminate the mth person

>Re-enqueue the eliminated person

4) The last person in the queue is the answer.
